

Matador has established a design for a radial windscreen wiper arm that provides the facility for engagement with either an under-hook or bolt-on type of wiper blade. These wiper arms come in either 12 DIN, 14 DIN and 16 DIN configuration

Our radial wiper arm will directly interchange with those currently used in bus applications and can be supplied with a clip width of 21mm or 28mm to fit our various standard wiper blades.

It will be seen from the pictures that the wiper arm has been designed and manufactured in such a manner that it presents a pleasing smoothness of profile and stylish appearance that complements the front of the vehicle. The arm is finished in a semi-matt black colour process achieved by the electrophoretic paint deposition process coupled with a further protective surface that prevents discolouration by ultra violet light.

Variety of clip sizes and travelling jets.

Exhaustive testing has been carried out on accelerated life test rigs giving rise to exceptional durability performance standards that more than exceed any known OEM specification. These tests have been further supported by road trials on high speed bus and coach applications where corresponding results have also been achieved.
