

**Large single arm wiper system typical of the type used on prestige sports cars. Linkage design is based upon the Tibochev principle.**

These swivel assemblies are required to ensure that as the system operates and the wiper arms start moving from Park through their wiping cycle, they will not collide with one another. This is achieved by altering the rate of movement of the two wiper arms such that one is accelerated at the start of its stroke in comparison with deceleration of the other.

This style of system is purpose designed and tested for use on production vehicles. The associated wiper arm and wiper blade is also supplied.
